EFFICIENT ANALYSIS OF PATENTS

GENERAL

A patent helps in the search for alternative technical solutions and in determining the current state of the art. Developing information from patent specifications is often perceived by technicians and developers as very laborious and time-consuming. The information from the patent documentation is used little or not at all by the employees and employers. It is very important to note that patent-protected information is the property of the patent holder and therefore cannot be used anymore or only with the permission of the patent holder.

The seminar is composed of theoretical parts and practical exercises. This ensures that the seminar participant can use the information and content of a patent specification more easily and effectively the day after the seminar and can immediately apply what he/she has learned in his/her working life.

TOPICS

- General principles of the patent granting procedure using the example of the European patent
- Protection possibilities
- Design/structure of a patent
- Meaning of patent claims
- Identifying important core information
- Efficient reading of a patent specification
- Theory and practical examples

AIM OF THE SEMINAR

After the seminar, seminar participants can read, understand, select and utilize Intellectual Property Rights quickly and efficiently. It is relevant for an employee how he or she obtains the information important to him/her from the patent literature at the beginning of a project in a fast and effective way. In this way he/she avoids that the project knowledge acquired may already be protected as a patent for the benefit of another party and may therefore no longer be used by the company. Especially important: To extract the information already published in the patent literature (state of the art) before the start of each project.

SEMINAR ADVANTAGES

The orientation towards the needs of the company and the individual wishes of the client results in an enormous practical relevance. First approaches for practical solutions are developed in the seminar and the results can be implemented and applied immediately. This results in a great saving of time, since no extensive seminar preparation is necessary. A larger number of employees can be trained effectively at the company, thus eliminating travel expenses. Internal business matters are treated confidentially, as the seminar takes place within client's company and exclusively with the client's employees.

PARTICIPANTS

The target group of this seminar are employees from industry and universities who are responsible for technology and products. Up to 10 participants can be included in one course.

SCHEDULING

Appointments are arranged individually. The internal or external seminars last one day, plus discussion and elaboration (proposal).

SEMINAR FEES

On request we will be happy to send you a tailor-made offer by e-mail.
